Chiplun, India

ABSTRACT

Organizational citizenship Behaviours is being researched for last three decades by the researchers. It is sometimes compared with the prosocial behaviour, organizational spontaneity, extra role behaviour and contextual performance. Dennis Organ (1997), father of OCB has defined OCB as, "Individual Behaviour that is discretionary, not directly or explicitly recognized by the formal reward system, and in the aggregate promotes the efficient and effective functioning of the organization."

Different scales has been devised by the researchers to measure different Organizational citizenship behaviour for different types of respondents. The current study aims to test the reliability of standardized questionnaire while measuring the Organizational Citizenship Behaviour of the non – teaching staff in the academic sector. Doing this, test shall prove the relevance of the current scale for non – teaching staff that will surely direct the future researchers to develop a new scale for non – teaching staff.

Key words: Organizational citizenship behaviour scale, Non – teaching staff and reliability

1. INTRODUCTION

Organizational citizenship behavior concept was first identified by Dennis Organ, who is considered to be the father of Organizational citizenship behavior in the year 1988. He has defined as “Individual behaviour that is discretionary, not directly or explicitly recognized by the formal reward system, and that in the aggregate promotes the effective functioning of the organization.”

Organizational Citizenship Behavior are the explicit behaviours exhibited by employees that shows their sacrifices, their commitment and the prosperity of the organization. They defined them as “good soldiers” who act selflessly. According to Jon L. Pierce et.al. (2002), OCBs have these key features in comments:

- They are voluntary on the part of the employee.
- They are intentional ; the employee consciously, decides to perform them.
- They are intended to be positively valued by the employee and the organization.
- The behavior primarily benefits the organization (or co-workers) and not the employees themselves.

They also agree with opinion of the researchers having the types of OCB as Altruism, Compliance, Courtesy, Sportsmanship and Civic Virtue. In a research by Van Dyne people exhibiting OCB shall demonstrate Organizational Obedience, Loyalty and Participation. They also gave some measures to measure one's own level of OCB. They also gave concept of contractual relationship that talks about mutual benefits. As far as the determinants of OCBs are concerned, they gave two types : attitudinal (like Job satisfaction, Fairness, Commitment & Leader supportiveness) or dispositional (Conscientiousness, Agreeableness, Positive & Negative Affectivity)

Another interesting finding by Organ & Ryan that employee moral can be the best predictor of whether employee will display OCB. Different management practices has direct or indirect effects on employee attitudes. Thus it shows that conducive practices or environment shall be a trigger for the high employee morale which in turn can led to exhibition of OCB.

There was also a great curiosity among the researchers regarding why the people should engage in such kind of activity. Hence, John W. Newstrom (2009) has talked about few reasons behind these ‘good soldiers’ engage in these actions:

- Their personality disposes them to do so.
- They hope that by doing so they will receive special recognition or rewards.
- They are attempting to engage in image enhancement through managing the impressions that others forms of them.

There are different types of OCB which Fred Luthans (2011) has found as Loyalty OCBs, Service Delivering OCB, Participation OCBs that though all are undetected by the reward system but they all lead to high performance and increases effectiveness.

Apart from the above mentioned adjectives OCBs has also been called as “ House keeping behavior” by Gregory Moorhead & Ricky W. Griffin (2008) where apart from dos, they have mentioned about the don't's like finding fault with others, expressing displeasure, starting arguments and complaining about non – significant things. They have also mentioned about the probable factors affecting OCB like Working condition, pay etc. Another term used for OCB was Prosocial Behavior by

Jerald Greenberg, Robert A. Baron (1999). Prosocial Behavior is defined as the action performed by individuals or groups that assist others without expecting a favour in return.

Just as the employees have their own reasons to exhibit such behavior, similarly employers also need their employees to engage in Organizational Citizenship Behavior. According to Steven L. McShane et.al. (2010), "Various forms of cooperation and helpfulness to other that support the organization's social and psychological context." And thus OCB take many forms: Some are directed towards individuals which is known as Organizational citizenship behavior of individual (OCBI) and Organizational citizenship behavior of organization (OCBO).

2. MEASURES OF OCB

Different measures have been designed and developed by researchers. The researchers have the benefit of applying the diverse variety of culture specific scales.

The first scale was designed by Bateman and Organ (1983) which was used to measure Organizational citizenship behaviour. According to them, "OCB include any of those gestures (often taken for granted) that lubricate the social machinery of the organization but that do not directly inhere in the usual notion of task performance." This scale was a 30 item OCB scale that comprises of variety of types of OCB like cooperation, altruism, compliance, punctuality, housecleaning, protecting company property, conscientiously following company rules and dependability.

A 16-item scale was developed by Smith, Organ and Near (1983). According to them, "Citizenship Behaviors comprise a dimension if individual and group functioning... The latter was regarded as a function of the formal organization and the logic of facts." This scale comprises of two factors namely Altruism and Generalized Compliance.

The third scale was given by Podsakoff, MacKenzie, Moorman, and Fetter (1990), they identified the following five factors of Organizational Citizenship Behavior: Altruism, Conscientiousness, Sportsmanship, Courtesy and Civic virtue.

Fourth scale was developed by Williams and Anderson (1991) that defined that the Organizational citizenship Behavior has two broad categories : " a) OCBO – behaviours that benefit the organization in general (e.g. Gives advance notice when unable to come to work, adheres to informal rules devised to maintain order), and b) OCBI – behaviours that immediately benefit specific individuals and indirectly through this means contribute to the organization (e.g. helps others who have been absent, takes a personal interest in other employees)" This is a fourteen item scale with seven items on OCBO and seven items on OCBI.

Now there was a time for extension of basic domains of OCB and then Podsakoff and MacKenzie (1994) came with a 14 item scale which identified the two new forms of OCB namely peacekeeping and cheerleading along with the other conventional forms like Altruism, Courtesy, Civic Virtues and sportsmanship. In their words, " Organizational Citizenship Behavior (OCBs) are discretionary behaviours on the part of a salesperson that are believed to directly promote the effective functioning of an organization, without necessarily influencing a salesperson's objective sales productivity."

Another scale of OCB designed by Van dyne, Graham and Dienesch (1994) serves the need for Political science literature. They defined the fundamental categories as follows: " Organizational obedience reflects acceptance of the necessity

and desirability of national rules and regulations governing organizational structure, job description and personnel policies. “ This was a 34 item scale comprising items on obedience, loyalty, social participation, Advocacy Participation and Functional Participation.

The Van Dyne’s scale act as theoretical foundation for Moorman and Blakely (1995) when they came out with another scale on OCB. It was a 19 item scale that comprises of items on Interpersonal Helping, Individual initiative, Personal industry and Loyal Boosterism.

After so many research development in the western culture it was found that most of the researches, findings and measures were influenced by the western culture hence this attracted few researchers to design something that shall be applicable in china and may be in different cultures. And hence Farh, Earley and Lin (1997) came out with a global scale on OCB. This was a 20 item Chinese OCB scale comprising of items on Identification with the company, Altruism towards colleague, Conscientiousness, Interpersonal Harmony and Protecting company resources.

Till 1999, there was interest in Indian research as well towards this area. Few scales were developed by some Indian researchers as well. A scale by Sharma Vivek, Jain Sangeeta (2014) was developed for Manufacturing sector. It was a 36 item scale comprising of factors like altruism, Organizational compliance, Sportsmanship and Loyalty. Similarly another scale

Developed by Bakhshi Arti and Kumar Kuldeep (2009) to measure OCB of employees in any Indian organization. It is a 30 item scale comprising of items on Conscientiousness, Courtesy, Sportsmanship, Helping Co-workers and civic virtue.

Though the scale provided by Bakhshi Arti and Kumar Kuldeep (2009) claims to be an appropriate tool for any employee in any of the Indian organization, hence the researcher tried to find out if the scale is relevant for the non teaching staff as well in the organization.

Following are the list of some measures along with their psychometric properties:

3. RATIONALE FOR PRESENT STUDY

The present study aims to verify the feasibility of already existing scale on the non teaching staff in academics by testing its reliability for the aforesaid purpose.

4. RESEARCH METHODOLOGY

4.1. Standardized Scale

A standardized scale developed by Dr. Aarti Bakhshi and Kuldeep Kumar (2009) has been adopted for this study. The scale comprises of 30 items . These 30 items can be grouped into five sub factors.

It measures the five variables through different items in the following pattern:

Factor 1 - Conscientiousness is measured by items 1, 7, 10, 13, 17, 19, 20, 21 and 22.

Factor 2 - Courtesy measured by Items 4, 8, 16, 18, 23 and 28.

Factor 3 – Sportsmanship is measured by Items 3, 6,24,27,29,30. All the items under this factor are negative items.

Factor 4 – Helping co worker is measured by 2, 5, 9, 11and 25.

Factor 5 – civic virtue can be measured by 12, 14,15 and 26.

Table 1 Psychometric Properties of Various Scales

Study	Measure Used	Reliability Reported	Validity Reported
Findley, Giles and Mossholder (2000), Kar and Tewari (1999), Lam, Hui and Law (1999), Moorman (1991), Rioux and Penner (2001)	Measure developed by Podsakoff, Mackenzie, Moorman and Fetter (1990)	Yes	Not clearly stated
Van Dyne and Ang (1998)	Measure developed by Van Dyne and LePine (1998)	Yes	Yes
Williams, Pitre and Zainuba (2002)	Modified version of measure developed by Podsakoff & MacKenzie (1989)	Yes	Not clearly stated
Motowidlo and Van Scotter (1994)	Special measure developed for this study by authors	Yes	Not clearly stated
Chaitanya and Tripathi (2001)	Special measure developed for this study by authors	Not clearly stated	Not clearly stated
Van Dyne and LePine (1998)	Adapted measures from Organ and Konovsky (1989), Smith et al. (1983), Van Dyne, Graham and Dienesch (1994), Withey and Cooper (1989)	Yes	Yes
Van Scotter, Motowidlo and Cross (2000)	Special measure developed for this study by authors	Yes	Yes
Lambert (2000)	Adapted measures from Organ and Konovsky (1989), Smith et al. (1983)	Not Clearly Stated	Not Clearly Stated
Van Dyne, Graham and Dienesch (1994)	Developed by authors	Yes	Yes
Kiker and Motowidlo (1999)	Adopted from Van Scotter and Motowidlo (1996)	Yes	Not Clearly Stated

Source: Kumar Rajiv (2005), Organizational citizenship performance in Non – Governmental organizations development of a scale

According to Dr. Aarti Bakhshi & Kuldeep Kumar (2009) rating response in the questionnaire needs to be measured in points because once the data is collected, their number can be reduced by combining the items but it cannot be increased later. Hence the 5 point likert scale is used for data collection ie Never (1), Rarely (2), Sometimes (3), Frequently (4) and Always (5).

4.2. Sample characteristics and Collection of Data

The data was collected from the non – teaching staff of different institutes and colleges ie basically the academic sector. Among them 26% respondents are female and 74% are males. The respondents comprises of people from various designation starting from Peon, Jr clerk, Sr. Clerk and Section Officers. Their mean age was 34 years.

The data was collected by administering the questionnaire to the respondents individually. Since some of the respondents couldn't understand English hence the researcher has assisted the respondents while filling the questionnaire in making them understand the components of the questionnaire.

5. DATA ANALYSIS & INTERPRETATION

5.1. Item total Correlation

Item total correlation shows how one item is related to other item that are expected to be measuring a common construct by finding the correlation of an item to a score (sum) of the other items. If there is low correlation, it shows that the item doesn't fit best into the list of questions. Items with high correlation show high reliability and ensures the reliability of the proposed scale as well.

Table 2 Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
OCB1	108.74	102.654	.329	.691

OCB26	109.53	105.761	.041	.709
OCB27	110.81	99.109	.265	.692
OCB28	110.32	103.304	.096	.708
OCB29	110.71	107.685	-.044	.717
OCB30	112.19	107.700	-.002	.706

Table 2 shows the correlation between each item and a scale score that excludes that item. Items with negative item total correlation are not the good items and do not significantly correlate with the total score. Thus there are four items which are not significantly correlated but due to less number of items, the insignificant items has not been excluded.

To find out the important items out of the 30 items, these items were factor analyzed using principal component method. The factors were also rotated using orthogonal rotation (Varimax). Ten factors having Eigen values of more than 1 with total variance of 71.661 was found.

Table 3 Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	5.144	17.146	17.146	5.144	17.146	17.146	3.328	11.092	11.092
2	2.928	9.760	26.905	2.928	9.760	26.905	2.644	8.813	19.905

26	.167	.558	98.795						
27	.120	.398	99.193						
28	.099	.331	99.524						
29	.085	.284	99.808						
30	.058	.192	100.000						

5.2. Extraction Method

Principal component Analysis. Rotation Method: Varimax with Kaiser Normalization

Its important to identify the value of loading to be 0.33 as minimum absolute value. However, considering the sample size of 62, a loading of 0.70 was considered significant.

Table 4 Rotated Component Matrix^a										
	Component									
	1	2	3	4	5	6	7	8	9	10
OCB1										
OCB2										
OCB4									.792	
OCB5

OCB3										
OCB30										
OCB6										
OCB29										

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser

Normalization.

a. Rotation converged in 22 iterations.

All the significant factor loadings are shown in the Table 5. Also the communalities for each item is shown in the Table 3. It can be seen that only 9 items (4,8,11,13,17,19,22,24 and 25) can load significantly on different factors, so these items have been included in the scale and rest of the items who cannot show significant loadings are excluded from the scale.

5.3. Reliability Analysis

The reliability analysis has been done using SPSS version 16.0

Table 5 Reliability Statistics

Cronbach's Alpha	N of Items
.702	30

The value of Cronbach's Alpha for the item set is 0.702 which is greater than 0.7 and is usually considered to be good.

6. RESULTS & FINDINGS

Thus, by analyzing the above findings, it is found that for the final scale for non – teaching staff in academic sector, only 9 items (Sr. No. 4,8,11,13,17,19,22,24 and 25) were found to be significant and can be retained . Each statement is provided by 5 alternatives on Likert scale and the respondent is free to choose the most appropriate option. Amongst the items one item no. 24 is negative and rest are positive.

While analysing the data it is found that 95% of non teaching employees have high level of Organizational citizenship Behavior and only 5% were found to have less citizenship attitude in their behavior. Though while observing the same responses on sub scales as follows:

Conscientiousness - Only 3% of employees were found to have low conscientious behaviour and rest 97% were found to have high conscientiousness.

Courtesy – Strangely 37% of non – teaching employees were found to be low at courteous behaviour while 63% of them have high courteous behaviour.

Helping behaviour – Where 18% of non – teaching employees don't show helping behaviour where as approx 82% of employees are helpful in their behaviour.

Sportsmanship – Once again only 63% of employees have sportsmanship attitude which is quite low in comparison to other attitudes.

The results show that most of the non teaching staff are high at conscious behaviour ie they follow the rules voluntarily, do not take extra breaks, obey organization's rules and regulations by their own will and justify their pay by working and performing in the organization accordingly. Next important finding was that 82% of employees have helping behaviour i.e. they help their colleagues in personal and official work related problems and they take time out of their schedule to help their colleagues. Only 63% of employees are found to have courteous and Sportsmanship behaviour. Courteousness in behaviour denotes avoiding problems with other co-workers, do not abuse right of others and prevent problems with others. Well this is the area where the non – teaching employees need to focus. Another important factor is Sportsmanship that includes avoiding complaints on small issues, focus on what is

right rather than wrong side and not to find faults always in the organization . Hence this is the area where the non – teaching staff needs to work upon.

7. SCOPE FOR FURTHER RESEARCH

Despite the limitations faced by the researcher namely limitation of scope, limitation of sample size, time limitation etc, the study comes out with a relevant issue that the standardized questionnaire developed by Dr. Aarti Bakhshi & Kuldeep Kumar (2009) claimed to be an universal questionnaire for measuring the Organizational citizenship behaviour of Employees in any Indian organization. Whereas the current study disproves this idea, as it comes out with the findings that not all the items in the questionnaire are reliable when the standardized questionnaire is administered on the Non – teaching staff of Academic sector. Hence here is the scope for future researchers can be to design an Organizational Citizenship behaviour Scale applicable to non-teaching staff in academics. This research paper also gives an insight that not all scales can be adopted as it is for all the kind of samples. There has to be some modification or development of entirely new scale for measuring Organizational citizenship Behavior in different context or culture specific scales needs to be developed.
